

# SLAM

Simultaneous localisation and mapping

# Motivation

Location

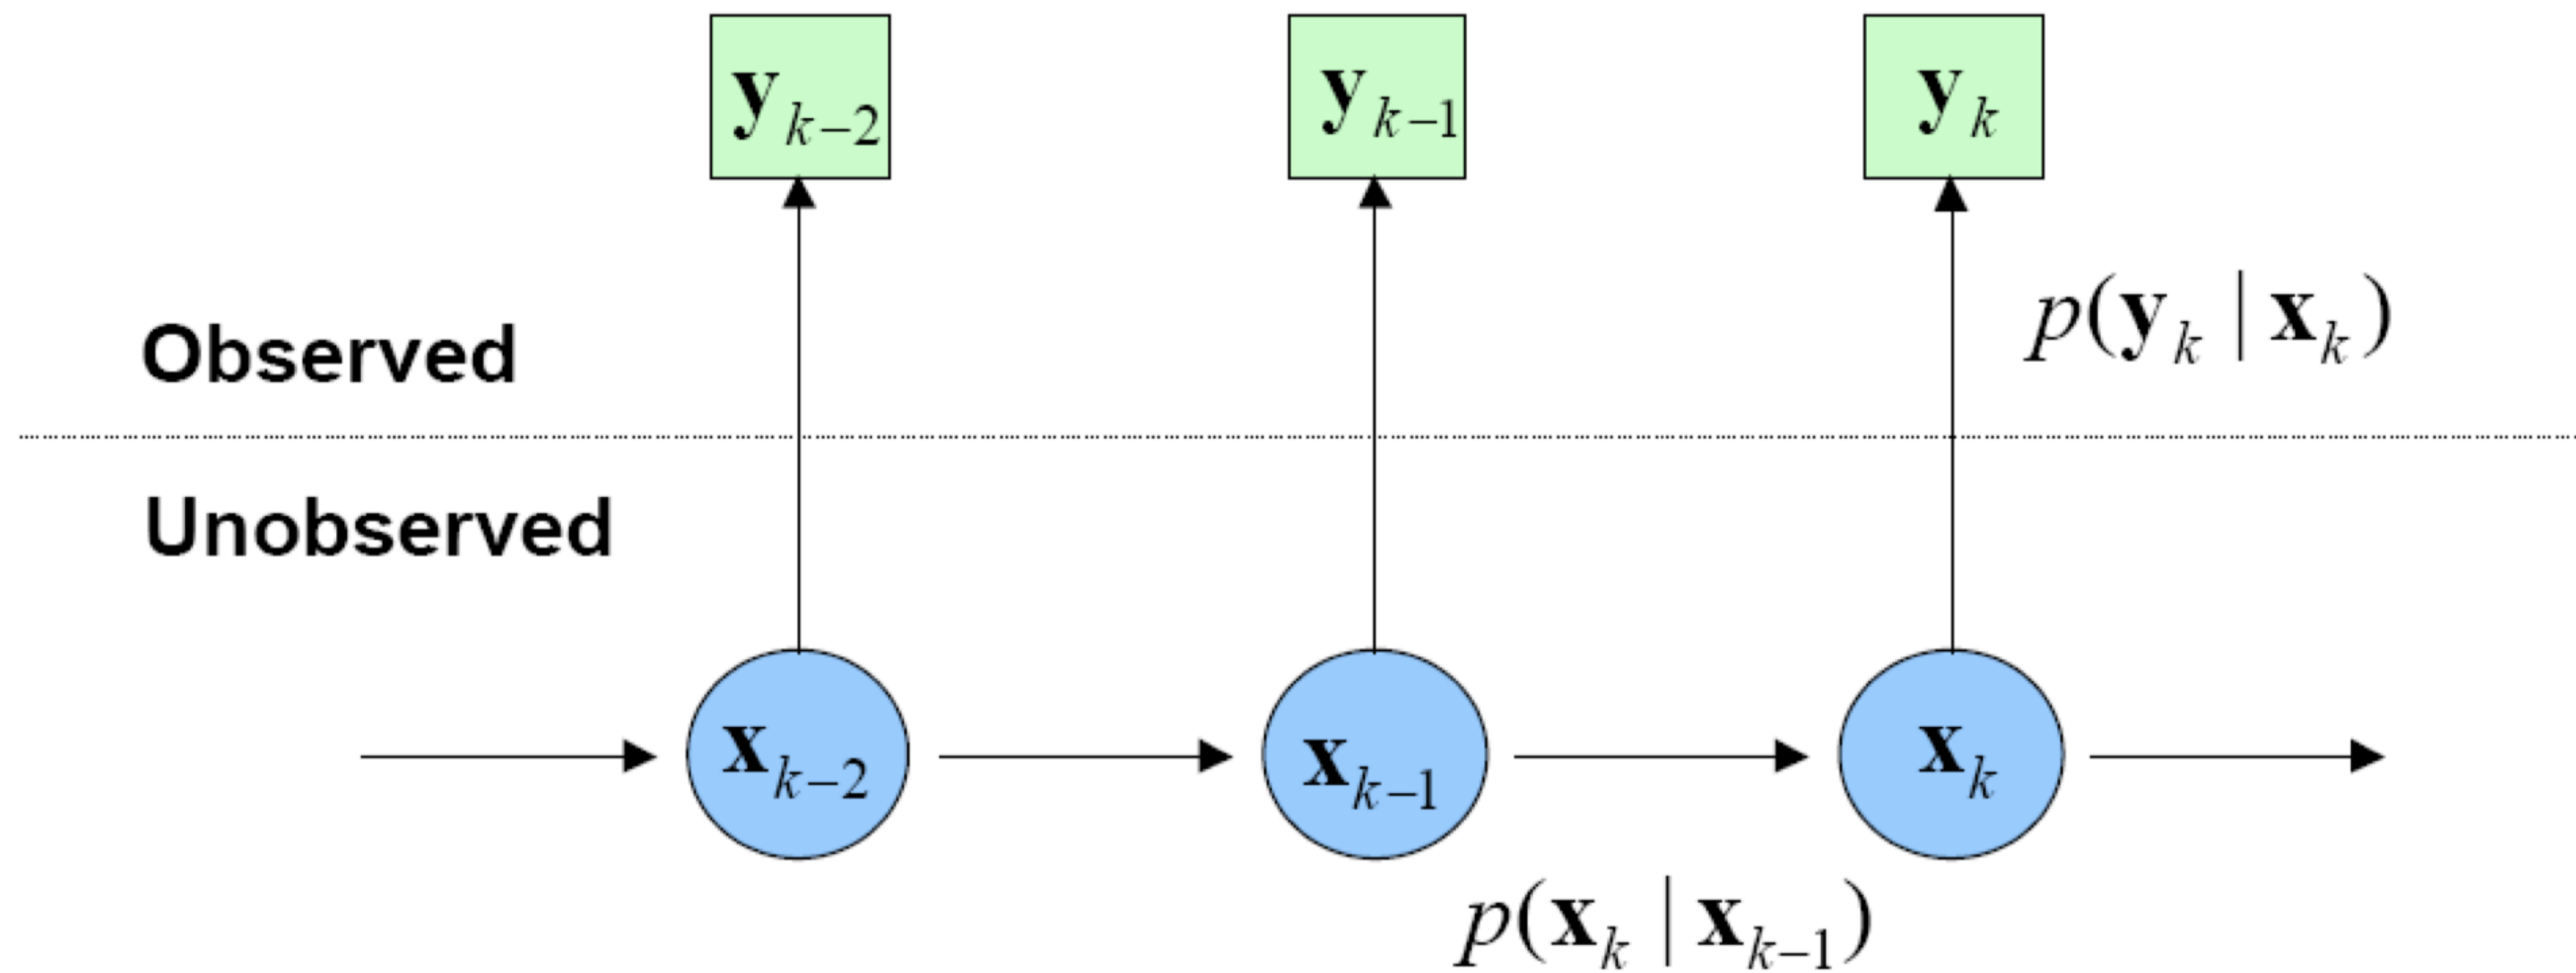

Map

# Expectation-maximisation algorithm

- estimate unobservable latent variable
  - in our case: position and orientation of rover
- alternating update
  - expectation step
  - maximisation step

# Filtering

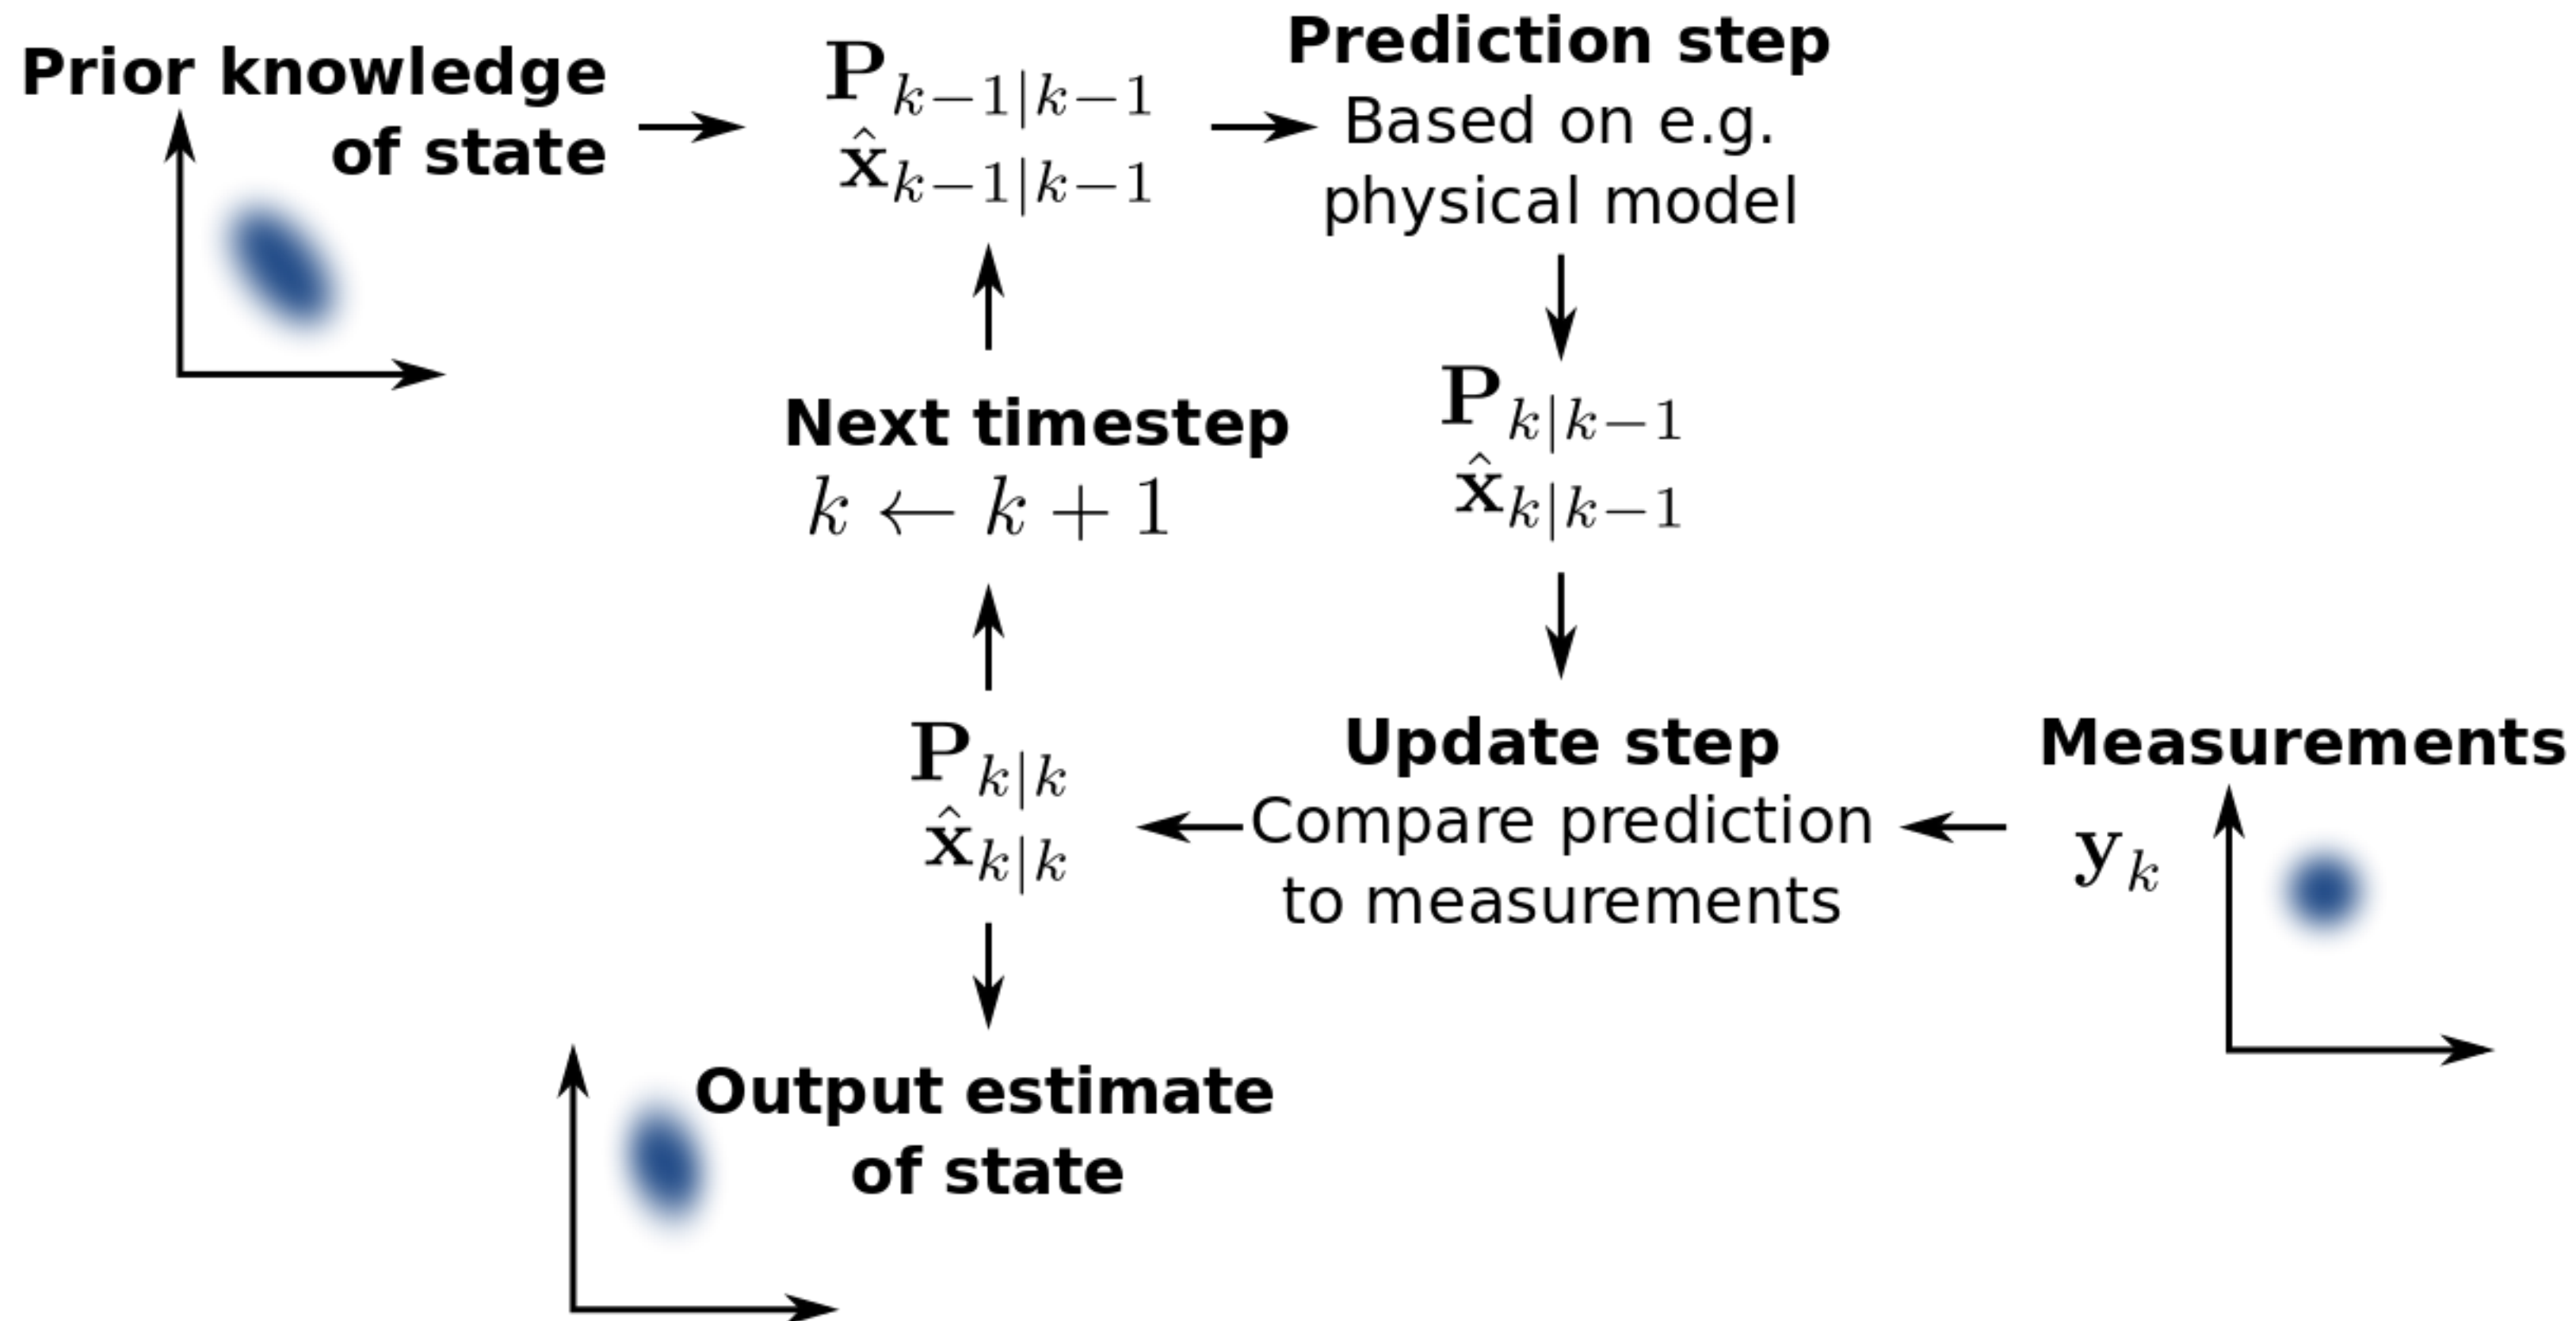

sequentially estimate the state as a set of observations becomes available

# Kalman Filter

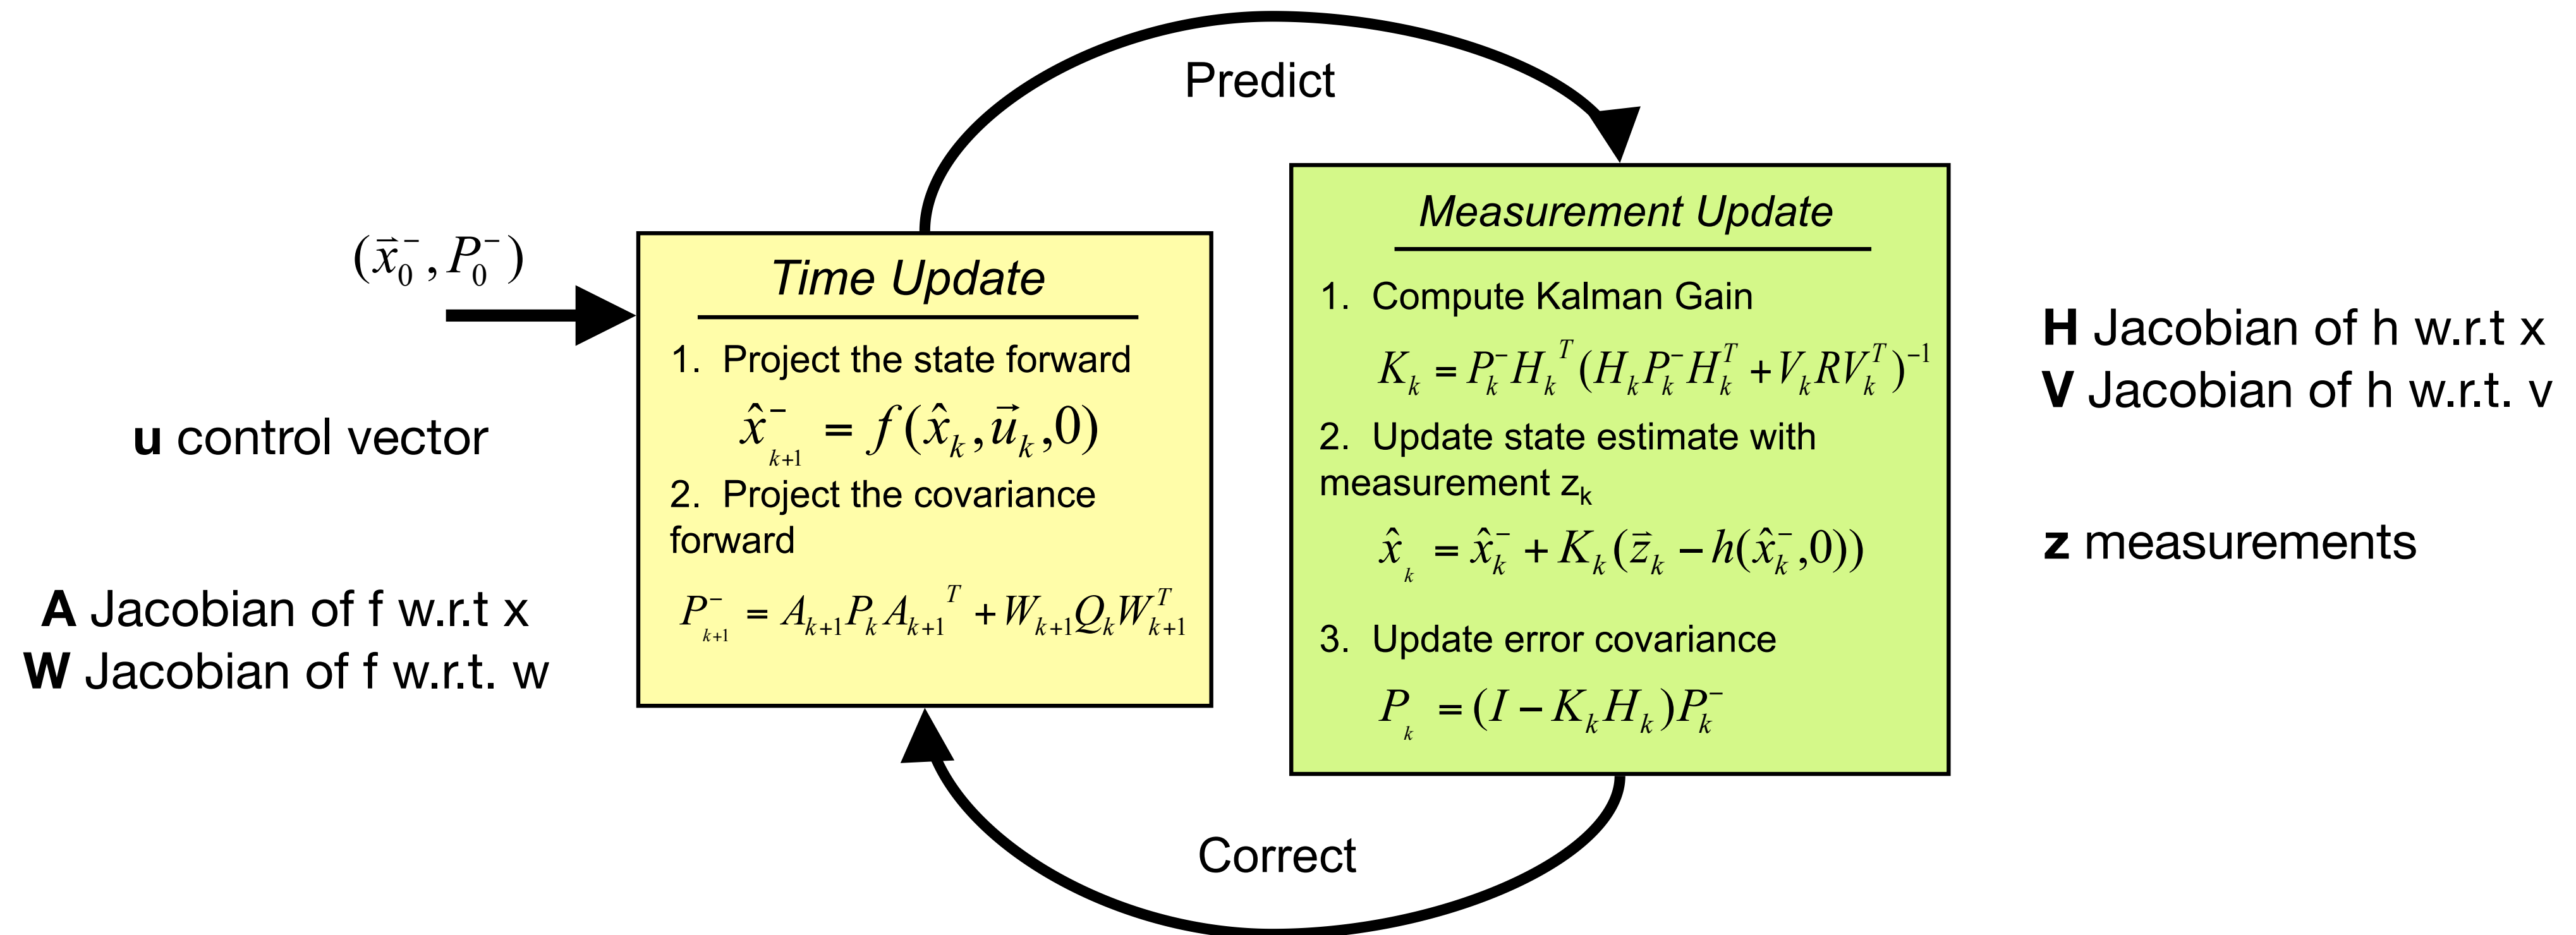

- maximum-a-posteriori estimation
- estimate of parameter
- estimate of uncertainty
  - Gaussian noise
- combine data over time
- extended Kalman Filter
  - estimate non-linearities

# Kalman Filter

# Extended Kalman Filter

## The Discrete Extended Kalman Filter

# Requirements EKF

- kinematic model
  - How does the control input influence the state?
- sensors
  - to measure environment
  - e.g. IMU, LIDAR, camera

# EKF-SLAM

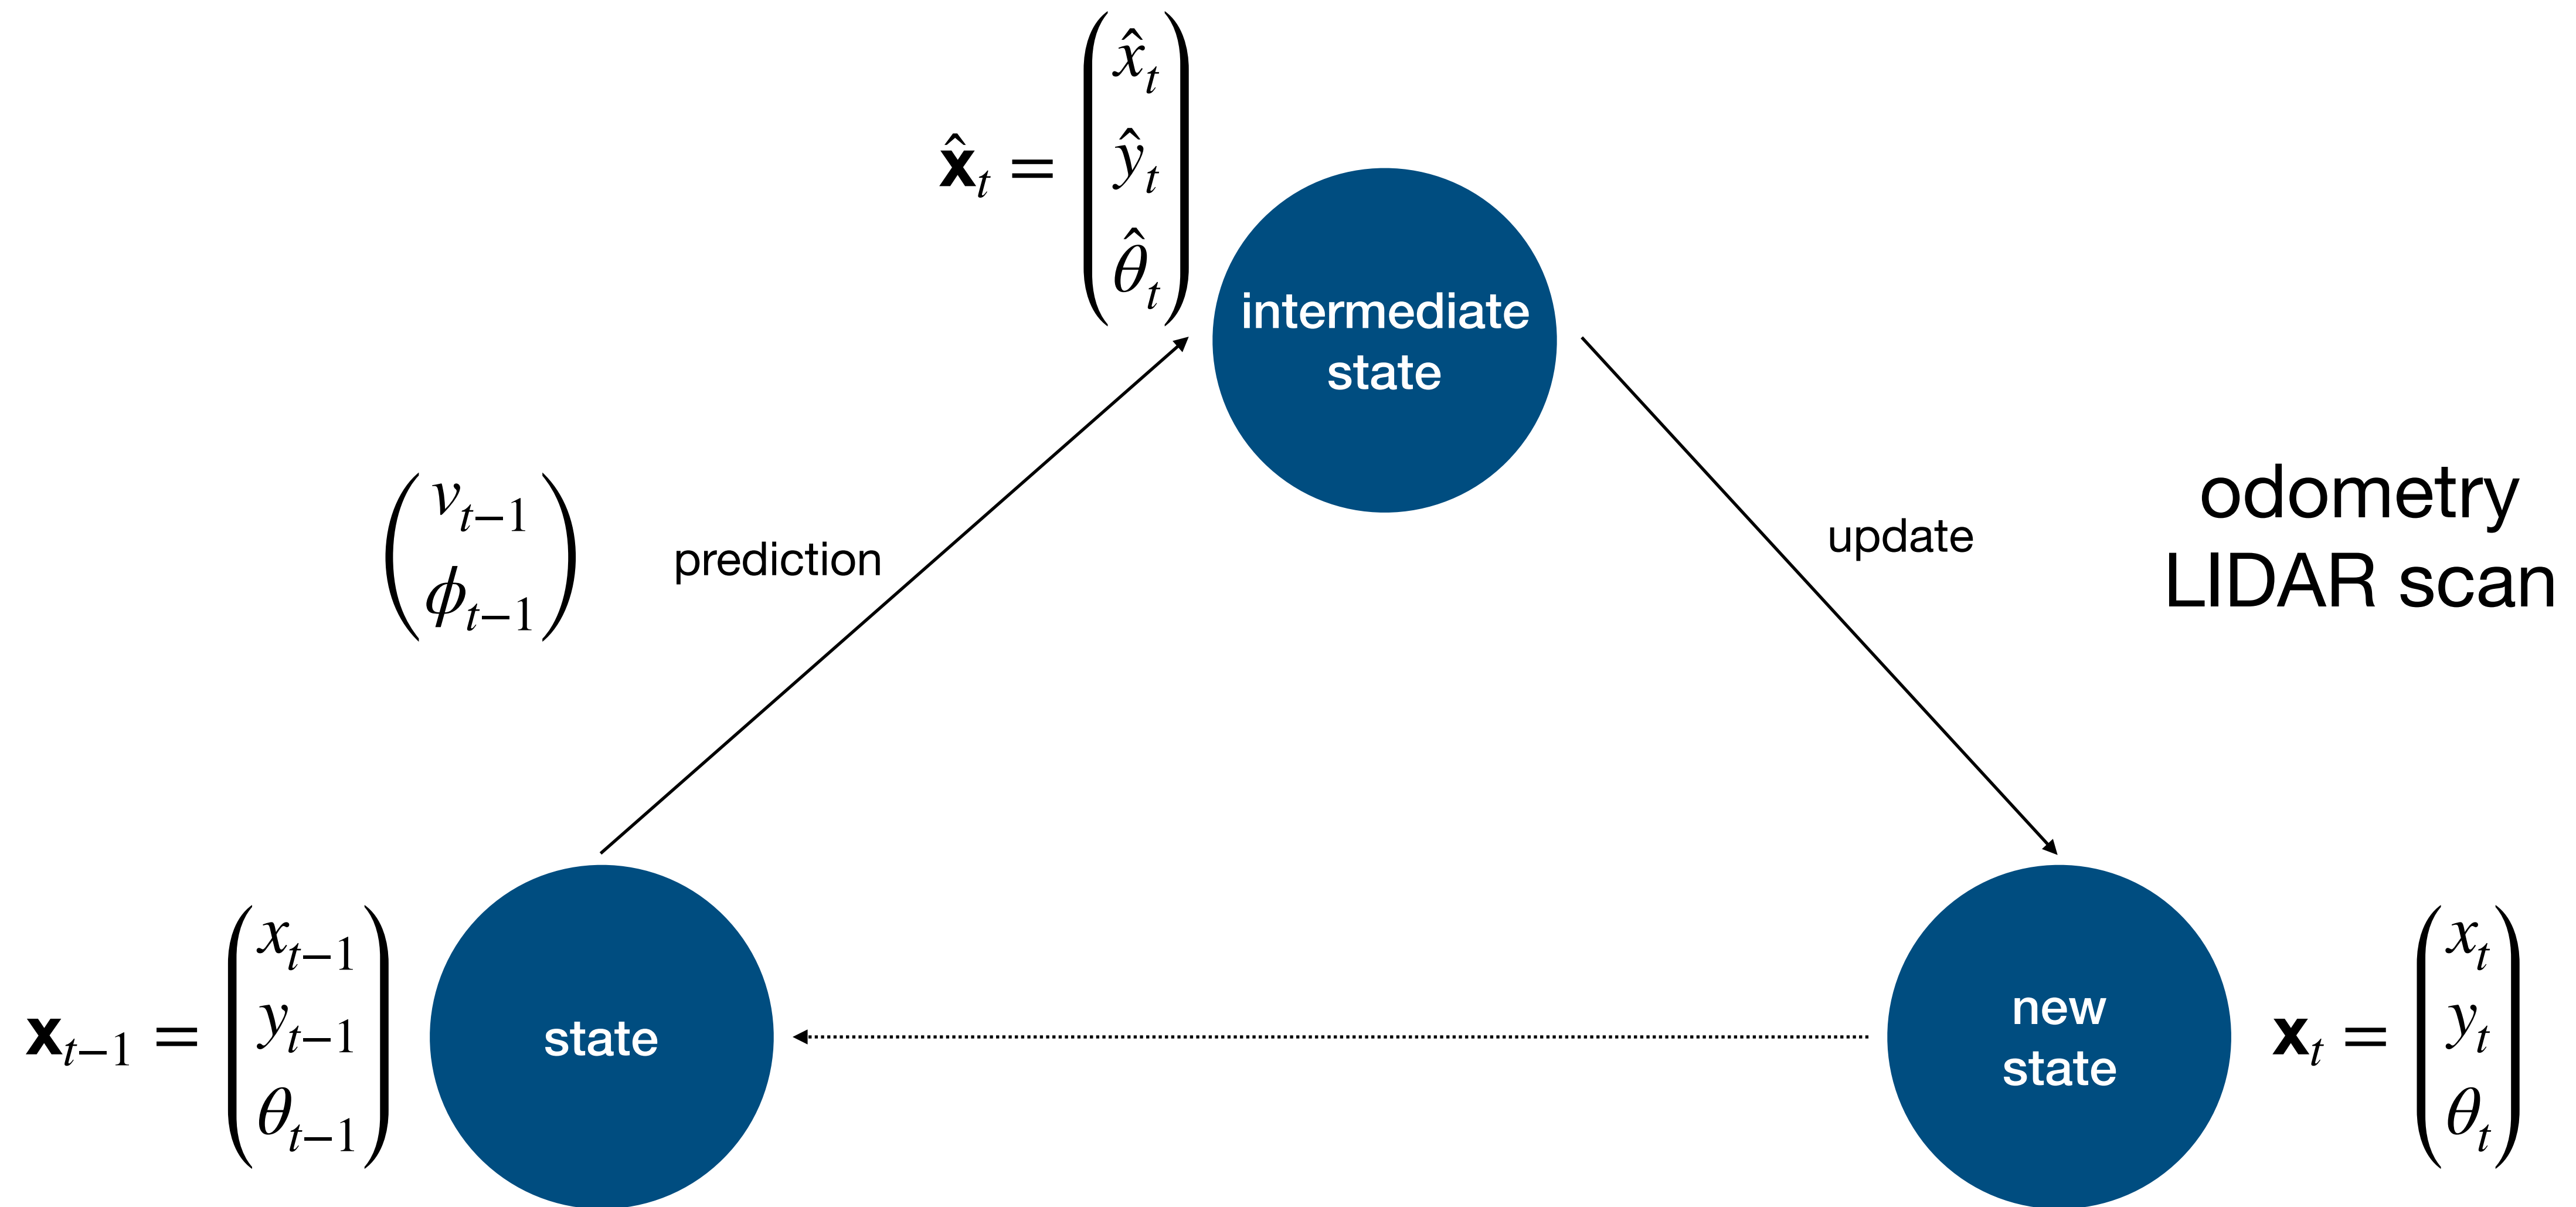

- incorporate landmarks into state
- landmarks are key points in the environment

# Difficulties

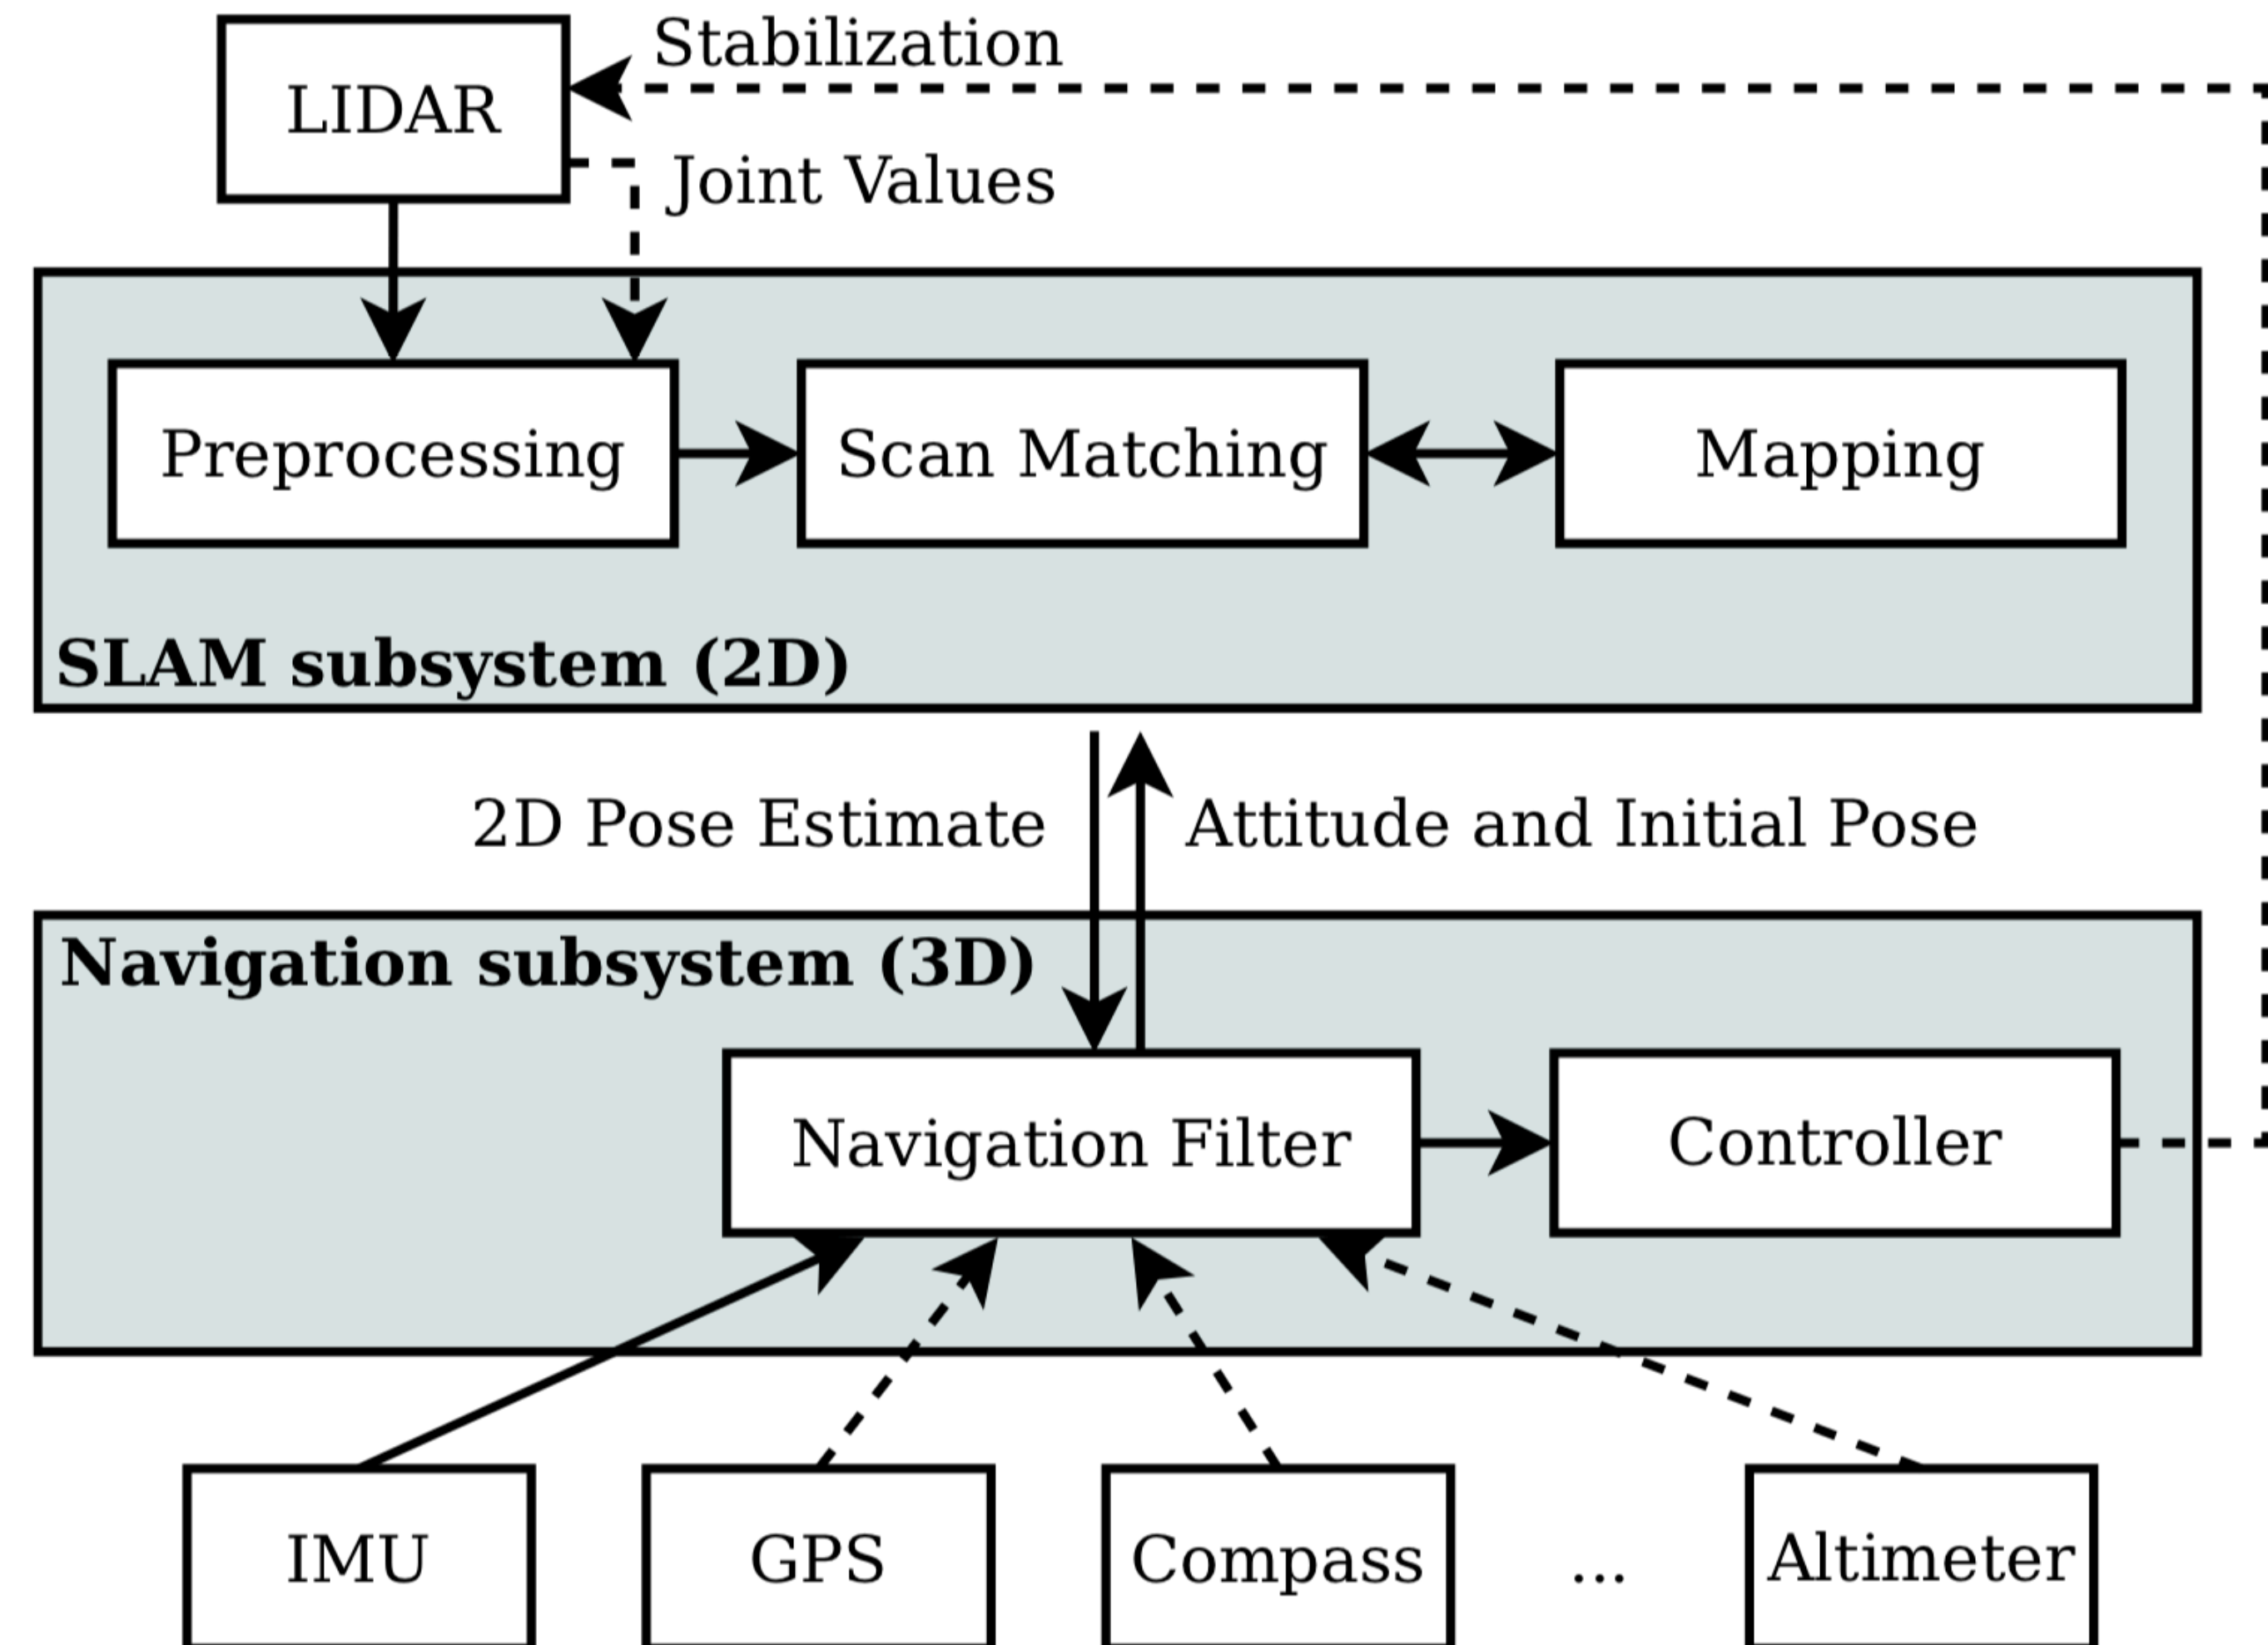

- dead reckoning
  - drift of position and orientation
  - increasing difference between true location and estimated location
- loop closure
  - recognise revisiting known areas

# Red Rover

# Hector SLAM

- low resources
- sensors
  - LIDAR
  - IMU
- right-handed coordinate system
- grid map
- EKF

# Particle Filter

- Monte Carlo method
  - sample based algorithm
- 1. Define a domain of possible inputs
- 2. Generate inputs randomly from a probability distribution
- 3. Perform computation
- 4. Aggregate the results
